Vectors and Array Lists

The Vector ADT (§5.1)

- The Vector ADT extends the notion of array by storing a sequence of arbitrary objects
- An element can be accessed, inserted or removed by specifying its rank (number of elements preceding it)
- An exception is thrown if an incorrect rank is specified (e.g., a negative rank)

- Main vector operations:
 - object elemAtRank(integer r): returns the element at rank r without removing it
 - object replaceAtRank(integer r, object o): replace the element at rank with o and return the old element
 - insertAtRank(integer r, object o):
 insert a new element o to have
 rank r
 - object removeAtRank(integer r): removes and returns the element at rank r
- Additional operations size() and isEmpty()

Applications of Vectors

- Direct applications
 - Sorted collection of objects (elementary database)
- Indirect applications
 - Auxiliary data structure for algorithms
 - Component of other data structures

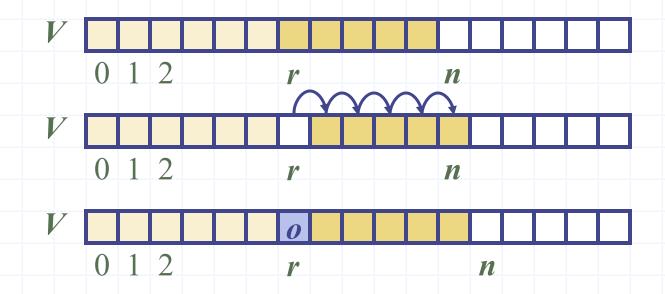

Array-based Vector

- lacktriangle Use an array V of size N
- A variable n keeps track of the size of the vector (number of elements stored)
- Operation elemAtRank(r) is implemented in O(1) time by returning V[r]

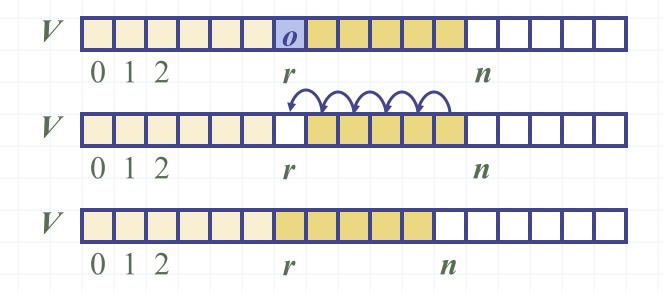

Insertion

- In operation insertAtRank(r, o), we need to make room for the new element by shifting forward the n-r elements V[r], ..., V[n-1]
- In the worst case (r = 0), this takes O(n) time

Deletion

- In operation removeAtRank(r), we need to fill the hole left by the removed element by shifting backward the n r 1 elements V[r + 1], ..., V[n 1]
- In the worst case (r = 0), this takes O(n) time

Vectors

Performance

- In the array based implementation of a Vector
 - The space used by the data structure is O(n)
 - size, isEmpty, elemAtRank and replaceAtRank run in
 O(1) time
 - insertAtRank and removeAtRank run in O(n) time
- If we use the array in a circular fashion, insertAtRank(0) and removeAtRank(0) run in O(1) time
- In an insertAtRank operation, when the array is full, instead of throwing an exception, we can replace the array with a larger one

Growable Array-based Vector

- In a push operation, when the array is full, instead of throwing an exception, we can replace the array with a larger one
- How large should the new array be?
 - incremental strategy:
 increase the size by a constant c
 - doubling strategy: double the size

```
Algorithm push(o)

if t = S.length - 1 then

A \leftarrow new array of

size ...

for i \leftarrow 0 to t do

A[i] \leftarrow S[i]

S \leftarrow A

t \leftarrow t + 1

S[t] \leftarrow o
```

Comparison of the Strategies

- We compare the incremental strategy and the doubling strategy by analyzing the total time T(n) needed to perform a series of n push operations
- We assume that we start with an empty stack represented by an array of size 1
- We call amortized time of a push operation the average time taken by a push over the series of operations, i.e., T(n)/n

Incremental Strategy Analysis

- We replace the array k = n/c times
- The total time T(n) of a series of n push operations is proportional to

$$n + c + 2c + 3c + 4c + ... + kc =$$
 $n + c(1 + 2 + 3 + ... + k) =$
 $n + ck(k + 1)/2$

- Since c is a constant, T(n) is $O(n + k^2)$, i.e., $O(n^2)$
- The amortized time of a push operation is O(n)

Doubling Strategy Analysis

- We replace the array $k = \log_2 n$ times
- The total time T(n) of a series of n push operations is proportional to

$$n + 1 + 2 + 4 + 8 + ... + 2^{k} =$$

 $n + 2^{k+1} - 1 = 2n - 1$

- T(n) is O(n)
- The amortized time of a push operation is O(1)
